Test Automation Lead

Professional Introduction | US Healthcare Insurance Exchange Platform

I am currently working as a Test Automation Lead on a US healthcare insurance exchange platform.

The application helps consumers explore and enrol in health insurance plans offered by different insurance providers. Our platform supports multiple US states, such as Georgia, New Jersey, Nevada, Oregon and Pennsylvania, where each state can have its own business rules and configurations.

My primary responsibility is to lead UI and API test automation, maintain regression coverage, improve our automation framework, and support release quality.

Our automation framework initially used Selenium WebDriver, and I have been involved in migrating it to Playwright to improve execution speed, test stability and maintainability.

We use Playwright with JavaScript, Cucumber for BDD, and the Page Object Model to maintain reusable page-level logic. We also maintain centralised selectors and reusable utilities to avoid duplication and make framework maintenance easier.

I am also responsible for integrating automated regression tests with Jenkins pipelines, analysing failures, identifying flaky tests, and ensuring that automation results are available to the team before releases.

From a leadership perspective, I work closely with developers, business analysts and other QA engineers during sprint planning, story refinement, defect triage and release validation. I also focus on improving test coverage and identifying automation opportunities early in the development lifecycle.
